                D1(i,j) = 2.*D1(i,j);
            end
        else
             D1(i,j) = -tp(i)./(2.*(1-tp(i).^2));
        end
    end
end
D1(1,1) = -(2.*N.^2+1)./6;
D1(N+1,N+1) = (2.*N.^2+1)./6;

D2 = D1*D1;

% RKM to get initial condition at t=1. error for each step is
 O(delT^3),
% so by using delT=0.0001 and 100 steps we have error O(1e-10), which
 is
% much less than the error for Crank-Nicolson: O(delT^2) using
 delT=0.01
% and 100 steps yields truncation error O(0.01). Therefore can use
 this
% Runge-Kutta approximate without disrupting the C-N estimate much.
delT = t1./100;
N2 = t1./delT;
